

Project Summary

COOPER OIL South Australia

Services provided include
Surveying & Engineering

Description: Infrastructure
Client: SANTOS Ltd
Timeframe: 2005 & ongoing

Fyfe is working with Santos to provide engineering & surveying services in the Cooper Basin

This project was initiated in mid-2005, with Stage 1 consisting of 51 wells drilled in the Tarbat area. A total of 300 wells have been drilled between 2006 to 2008, with a further 50 wells on schedule for 2009. As established engineering and survey consultants in the Cooper Basin, Fyfe completed the engineering and survey work for this major expansion in the previously little explored Tarbat area, near Eromanga in South West Queensland. Work included:

- Field planning of wells and facilities of a Greenfield site
- Well locations and surveys
- Flowline survey and design work including route selection for major gathering flowlines and individual well flowlines
- Route selection and set out of electrical lines to deliver power to the area
- Location, set out, front end engineering design of gathering lines and facilities

Approvals were required including Cultural Heritage, environmental and all required regulatory approvals for QLD and SA. Fyfe is proud to have surveyed and designed a cost effective pipeline network for existing wells and future field expansion.
